

## Mechanic/Technician Job Performance Test

**STATION 1**

### Identify Symbols

**Instructions:**

Identify the components and other information given by the symbol.

**Test Schematic**

## Mechanic/Technician Job Performance Test

**STATION 2**

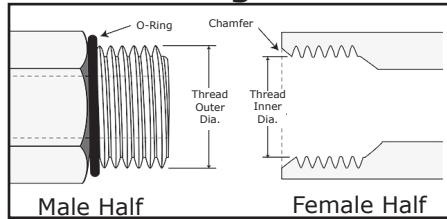

### Identify Fasteners & Fittings

**Instructions:**  
Choose the most correct answer  
for each fastener from the choices  
provided.

Identify the fittings provided. Look at  
each fitting and then select the correct  
answer on the multiple  
choice test.

## American Connections

### SAE J514 Straight Thread O-ring Boss (ORB)

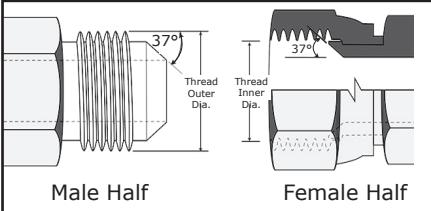

This port connection is recommended by the NFPA for optimum leakage control in medium and high-pressure hydraulic systems.

The male connector has a straight thread and an O-ring. The female port has a straight thread, a machined surface (minimum spotface) and a chamfer to accept the O-ring. The seal takes place by compressing the O-ring into the chamfer. The threads hold the connection mechanically.

thread and an O-ring. The female port has a straight thread, a machined surface (minimum spotface) and a chamfer to accept the O-ring. The seal takes place by compressing the O-ring into the chamfer. The threads hold the connection mechanically.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	5/16 - 24	5/16	0.31	9/32	0.27
3/16	03	3/8 - 24	3/8	0.38	11/32	0.34
1/4	04	7/16 - 20	7/16	0.44	13/32	0.39
5/16	05	1/2 - 20	1/2	0.50	15/32	0.45
3/8	06	9/16 - 18	9/16	0.56	17/32	0.51
1/2	08	3/4 - 16	3/4	0.75	11/16	0.69
5/8	10	7/8 - 14	7/8	0.88	13/16	0.81
3/4	12	1 1/16 - 12	1 1/16	1.06	1	0.98
1	16	1 5/16 - 12	1 5/16	1.31	1 1/4	1.23
1 1/4	20	1 5/8 - 12	1 5/8	1.63	1 9/16	1.54
1 1/2	24	1 7/8 - 12	1 7/8	1.88	1 13/16	1.79
2	32	2 1/2 - 12	2 1/2	2.50	2 7/16	2.42

### SAE J514 37°\* Hydraulic

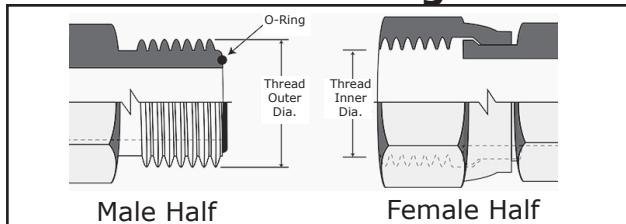

This connection is very common in fluid power systems. Both the male and female halves of the connections have 37° seats. The seal takes place by establishing a line contact between the male flare and the female cone seat. The threads hold the connection mechanically.

**Caution:** In the -02, -03, -04, -05, -08 and -10 sizes, the threads of the SAE 45° flare and the SAE 37° flare are the same. However, the sealing surface angles are not the same.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	5/16 - 24	5/16	0.31	9/32	0.27
3/16	03	3/8 - 24	3/8	0.38	11/32	0.34
1/4	04	7/16 - 20	7/16	0.44	13/32	0.39
5/16	05	1/2 - 20	1/2	0.50	15/32	0.45
3/8	06	9/16 - 18	9/16	0.56	17/32	0.51
1/2	08	3/4 - 16	3/4	0.75	11/16	0.69
5/8	10	7/8 - 14	7/8	0.88	13/16	0.81
3/4	12	1 1/16 - 12	1 1/16	1.06	1	0.98
1	16	1 5/16 - 12	1 5/16	1.31	1 1/4	1.23
1 1/4	20	1 5/8 - 12	1 5/8	1.63	1 9/16	1.54
1 1/2	24	1 7/8 - 12	1 7/8	1.88	1 13/16	1.79
2	32	2 1/2 - 12	2 1/2	2.50	2 7/16	2.42

\*This connection was formerly known as JIC.

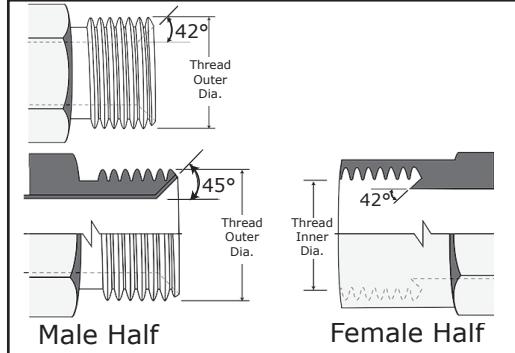

## ORS SAE J1453 O-ring Face Seal

This connection offers the very best leakage control available today. The male connector has a straight thread and an O-ring in the face. The female has a straight thread and a machined flat face. The seal takes place by compressing the O-ring onto the flat face of the female, similar to the split flange type fitting. The threads hold the connection mechanically.

Inch size	Dash size	Nominal Thread size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/4	04	9/16 - 18	9/16	0.56	17/32	0.51
3/8	06	11/16 - 16	11/16	0.69	5/8	0.63
1/2	08	13/16 - 16	13/16	0.82	3/4	0.75
5/8	10	1 - 14	1	1.00	15/16	0.93
3/4	12	1 3/16 - 12	1 3/16	1.19	1 1/8	1.11
1	16	1 7/16 - 12	1 7/16	1.44	1 3/8	1.36
1 1/4	20	1 11/16 - 12	1 11/16	1.69	1 5/8	1.61
1 1/2	24	2 - 12	2	2.00	1 15/16	1.92

### SAE J512 Inverted

This connection is frequently used in automotive systems. The male connector can either be a 45° flare in the tube fitting form or a 42° seat in the machined adapter form. The female has a straight thread with a 42° inverted flare. The seal takes place on the flared surfaces. The threads hold the connection mechanically.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	5/16 - 28	5/16	0.32	9/32	0.28
3/16	03	3/8 - 24	3/8	0.38	11/32	0.34
1/4	04	7/16 - 24	7/16	0.44	13/32	0.40
5/16	05	1/2 - 20	1/2	0.50	15/32	0.45
3/8	06	5/8 - 18	5/8	0.63	9/16	0.57
7/16	07	1 1/16 - 18	1 1/16	0.69	5/8	0.63
1/2	08	3/4 - 18	3/4	0.75	23/32	0.70
5/8	10	7/8 - 18	7/8	0.88	13/16	0.82
3/4	12	1 1/16 - 16	1 1/16	1.06	1	1.00

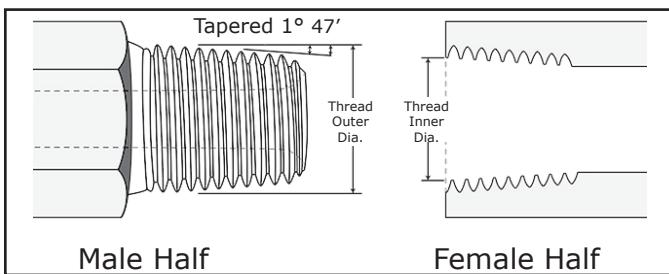

## How to Measure Non-threaded Connections

Four Bolt Flange — First measure the port hole diameter using the caliper. Next, measure the longest bolt hole spacing from center-to-center or measure the flange head diameter.

Staplok® — Measure the male diameter with the OD portion of the caliper. Measure the female half by inserting the ID portion of the caliper into the through hole.

### American Connections

#### NPTF (National Pipe Tapered Fuel)

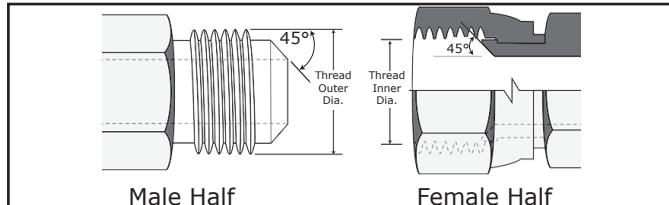

This connection is still widely used in fluid power systems, even though it is not recommended by the National Fluid Power Association (N.F.P.A.) for use in hydraulic applications. The thread is tapered and the seal takes place by deformation of the threads.

**NPTF Threads** Measure the thread diameter and subtract 1/4-inch to find the nominal pipe size.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	1/8 - 27	13/32	0.41	3/8	0.38
1/4	04	1/4 - 18	17/32	0.54	1/2	0.49
3/8	06	3/8 - 18	11/16	0.68	5/8	0.63
1/2	08	1/2 - 14	27/32	0.84	25/32	0.77
3/4	12	3/4 - 14	1 1/16	1.05	1	0.98
1	16	1 - 11 1/2	1 5/16	1.32	1 1/4	1.24
1 1/4	20	1 1/4 - 11 1/2	1 21/32	1.66	1 19/32	1.58
1 1/2	24	1 1/2 - 11 1/2	1 29/32	1.90	1 13/16	1.82
2	32	2 - 11 1/2	2 3/8	2.38	2 5/16	2.30

### SAE J512 45°

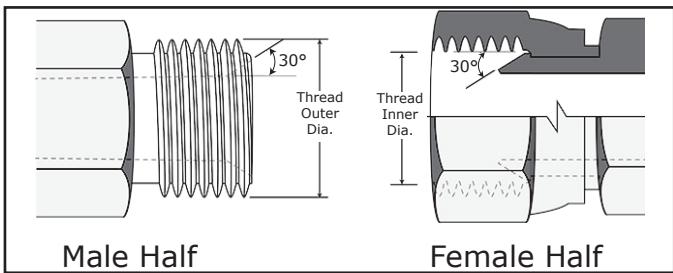

This connection is commonly used in refrigeration, automotive and truck piping systems. The connector is frequently made of brass. Both the male and female connectors have 45° seats. The seal takes place between the male flare and the female cone seat. The threads hold the connection mechanically.

**Caution:** In the -02, -03, -04, -05, -08 and -10 sizes, the threads of the SAE 45° flare and SAE 37° flare are the same. However, the sealing surface angles are not the same.

## Dash Numbers

Most fluid piping system sizes in the United States are measured by dash numbers. These are universally used abbreviations for the size of the component expressed as the numerator of the fraction with the denominator always being 16. For example, a -04 port is 4/16 or 1/4-inch. Dash numbers are usually nominal (in name only) and are abbreviations that make ordering of components easier.

### NPSM (National Pipe Straight Mechanical)

This connection is sometimes used in fluid power systems. The female half has a straight thread and an inverted 30° seat. The male half of the connection has a straight thread and a 30° internal chamfer. The seal takes place by compression of the 30° seat on the chamfer. The threads hold the connection mechanically.

**Note:** A properly chamfered NPTF male will also seal with the NPSM female.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	1/8 - 27	13/32	0.41	3/8	0.38
1/4	04	1/4 - 18	17/32	0.54	1/2	0.49

## Station 2

## Laminate 3 of 5

### SAE J518 4-Bolt Flange\*

This connection is commonly used in fluid power systems. There are two pressure ratings. Code 61 is referred to as the "standard" series and Code 62 is the "6000 psi" series. The design concept for both series is the same, but the bolt hole spacing and flanged head diameters are larger for the higher pressure, Code 62 connection.

The female (port) is an unthreaded hole with four bolt holes in a rectangular pattern around the port. The male consists of a flanged head, grooved for an O-ring, and either a captive flange or split flange halves with bolt holes to match the port. The seal takes place on the O-ring, which is compressed between the flange head and the flat surface surrounding the port. The threaded bolts hold the connection together.

\*SAE J518, JIS B 8363, ISO/DIS 6162 and DIN 20066 are interchangeable, except for bolt sizes.

**How to Measure - Four Bolt Flange** – First measure the port hole diameter using the caliper. Next, measure the longest bolt hole spacing from center-to-center or measure the flanged head diameter.

**Table 1**

Nominal Size					ISO and SAE Code 61 Flange Data

## **Mechanic/Technician Job Performance Test**

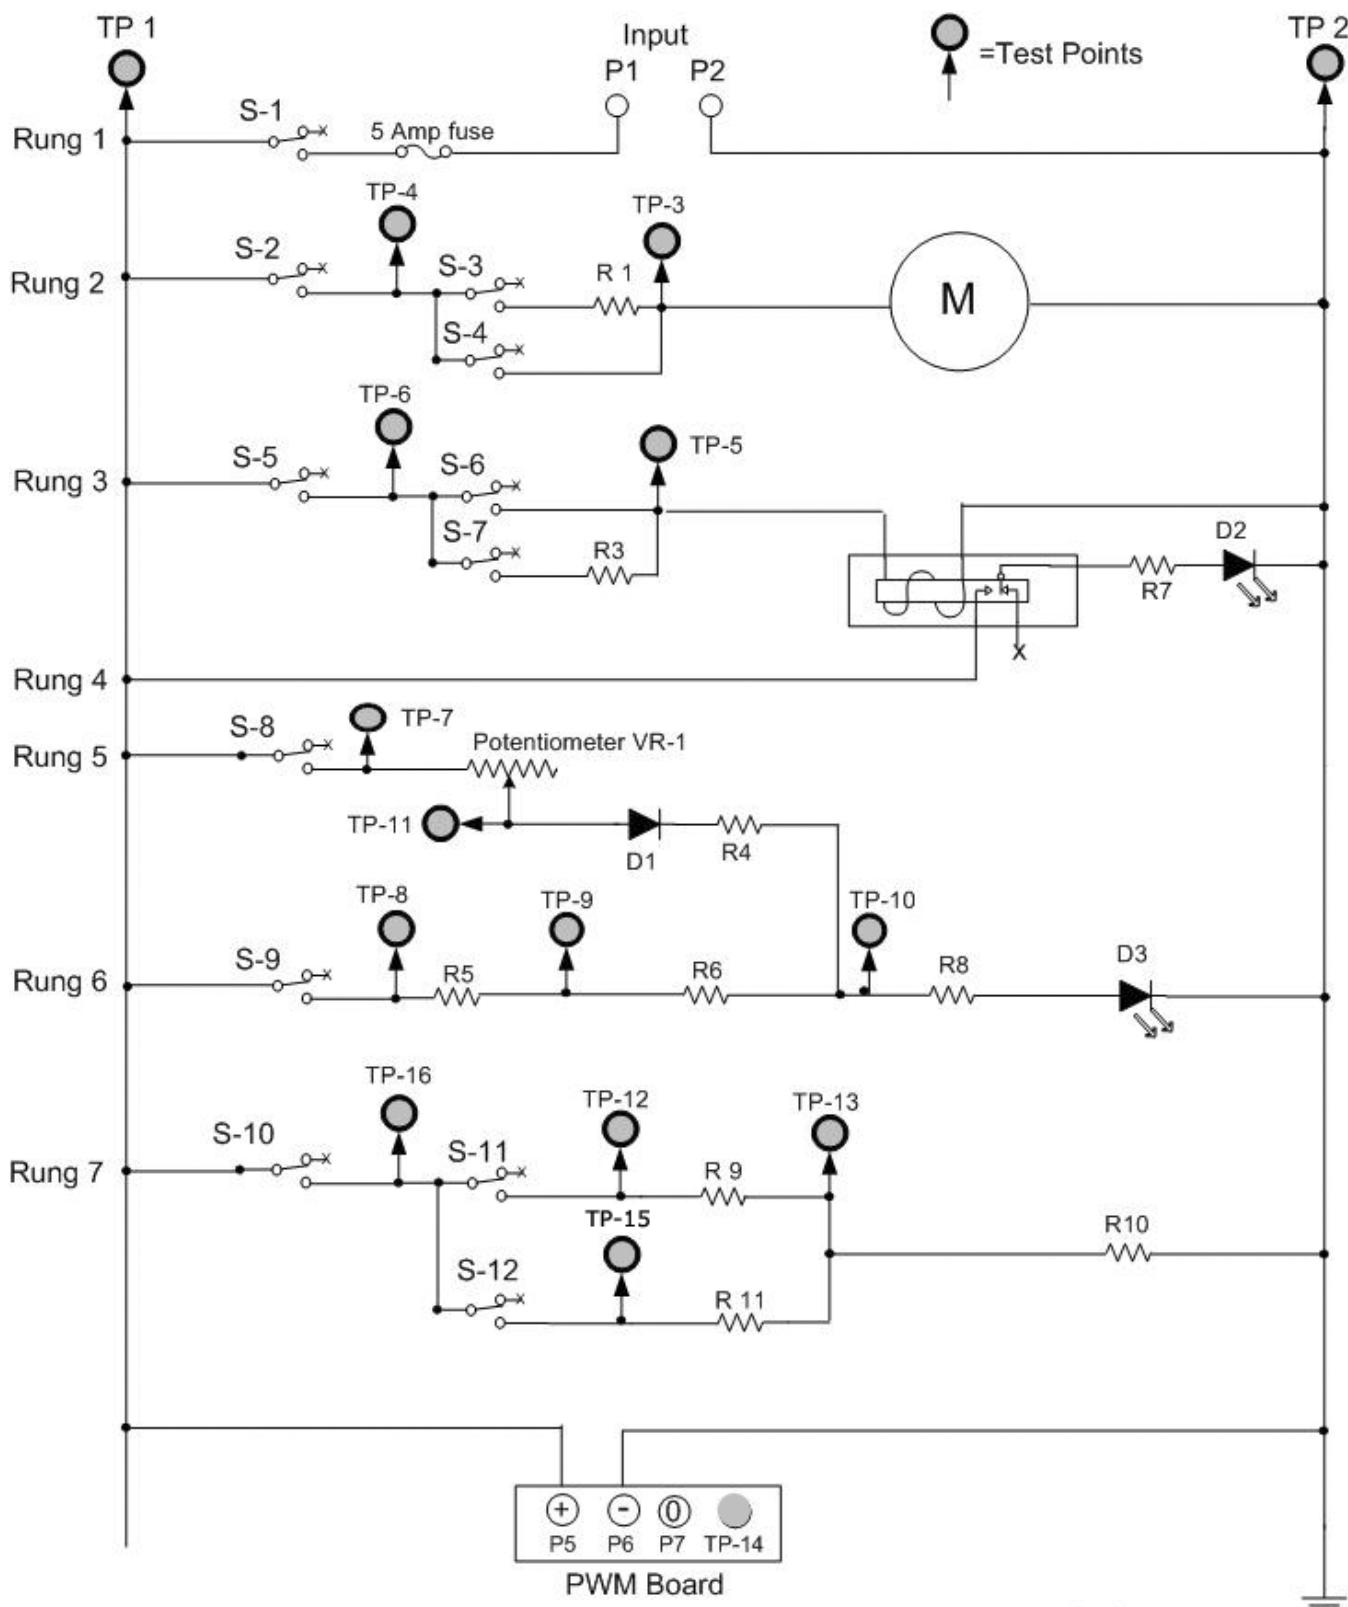

### **STATION 3**

## **Electrical**

#### **Instructions:**

Utilize multimeter to measure voltage, amperage, and resistance.

JP-3 - Test Schematic

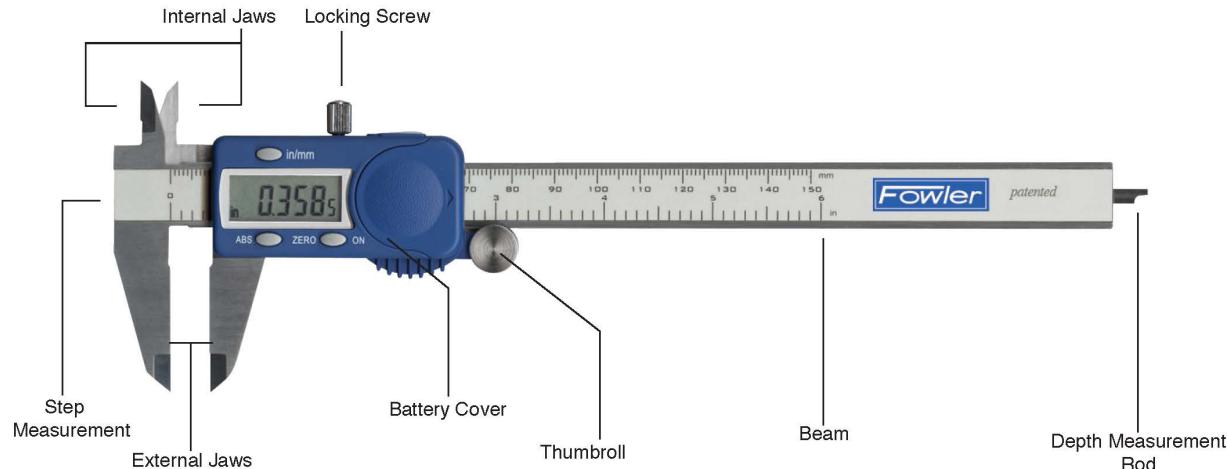

## Mechanic/Technician Job Performance Test

### STATION 4

# Measure a Cylinder Piston

#### Instructions:

Measure the cylinder piston using a scale, caliper and micrometer. Write the measurements in the space provided on your handout sheet.

### Functions

**On/Zero:** Press <on> function button. Press button an additional time to zero. Caliper features auto-off function.

**Zero Setting:** Press <zero> function button.

**Change Measuring Standard:** Press <inch/mm> function button.

**Absolute/Incremental:** Press <abs> button, to return to zero function press button again.

**RS232 data output:** By connection cable (not included). The 54-100-004-1 does not have RS232 capabilities.

### Battery Replacement

- Slide off the battery cover, then remove the battery by gently tapping the instrument in your hand. (Never try to force or pry the battery out). Insert the new battery with the positive pole "+" facing upwards and replace the cover.

- Please dispose of used batteries at a proper collection center.

### Cleaning

Clean the caliper with a soft cloth and a few drops of clock oil. DO NOT use any type of solvent. DO NOT immerse the caliper in liquid.

### Troubleshooting Chart

#### Symptom

- Digits do not change or count correctly
- No Display

#### Corrective Action

- Remove the battery for 30 seconds then reinstall.
- Check battery contacts or replace battery.

**RESET:** In order to RESET the instrument, remove the battery, wait 30 seconds, replace the battery and turn the instrument on.

**Precautions:** Although a top quality product, certain precautions are required for any electronic instrument:

- Avoid exposure to all liquids and excessive humidity.
- Avoid exposure to electromagnetic fields.
- Do not expose the instrument to direct sunlight.
- Do not attempt to disassemble the caliper for extended periods of time.

### Technical Data

#### Measuring Range:

0-6"/150mm or 0-12"/300mm

.0005"/.01mm

#### Resolution:

.0005"/.01mm

#### Accuracy:

.0005"/.01mm

6"/150mm:  $\pm .001"/.02\text{mm}$ ; 12"/300mm:  $\pm .0016"/.04\text{mm}$

#### • Repeatability:

.0005"/.01mm

#### • Measuring system:

Capacitive

#### • Display:

LCD (7.0 mm high)

#### • Maximum Measuring Speed:

120" per second

#### • Battery:

3V, type CR2032 Lithium

(Part #: 5U085)

#### • Battery life:

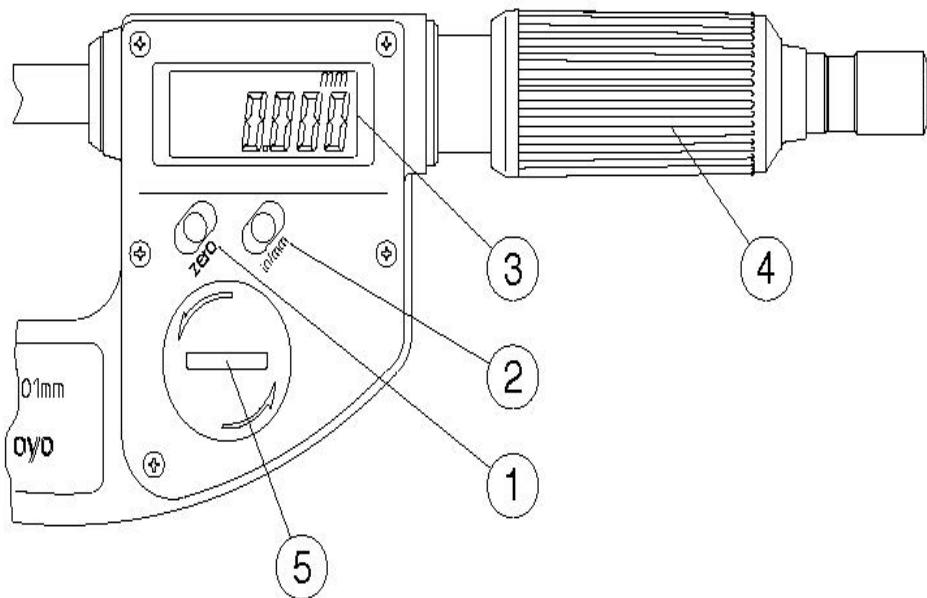

Approx. 1 year

#### • Operational Temperature Range:

0°C to +40°C

#### • Maximum Relative Humidity:

80%

1. ZERO button
2. Millimeter/Inch conversion
3. LCD Display
4. Thimble
5. Battery Cap (on back)

### **Button Function and Alarms**

1. Button functions

ZERO button: If pressed, it zero-sets the display value.

2. Display indicators

B : Low battery voltage. Immediately replace the battery.

E-oS : Error due to electrical noise or overspeed. Set the origin again, as described in "[4] Setting The Origin". This micrometer is not provided with the ON/OFF switch. The display unit (LCD) is always turned on. Since the display unit (LCD) consumes only a little power, the battery life is available for 1.2 years under normal use.

### **Setting The Origin**

#### **IMPORTANT:**

- Before measuring check the origin (datum-point) according to the steps below.
- Remove dust/oil from the measuring faces before origin setting.

1. Turn the thimble to gently bring the spindle into contact with the anvil. Apply the rated measuring force using the ratchet stop/friction thimble.
2. Press the ZERO button.
3. "0.000" appears, indicating the origin has been set

## **Mechanic/Technician Job Performance Test**

**STATION 5**

# **Measure Fluid Conductors and Determine Operating Pressure**

### **Instructions:**

Make the appropriate measurements of the six fluid conductor samples provided. Determine the burst pressure and working pressure (Safety Factor = 4:1). Write your answers in the spaces provided on the test sheet.

## Steel Tubing Data

Steel tubing is called out by outside diameter and wall thickness. For hydraulic plumbing, use a low carbon seamless steel tubing which can be bent and flared without cracking. Order "hydraulic grade" tubing. Pressure ratings in this table are based on a tubing with tensile strength of 55,000 PSI, and were calculated by Barlow's formula:  $P = (2t \cdot S) / O$ , in which P = burst strength in PSI, t = wall thickness, S = tensile strength in PSI, and O = outside diameter. This formula may be used to calculate tubing sizes not listed. For pressure rating at other safety factors, take burst PSI and divide by desired design factor.

Tube Dimensions (English)				Carbon Steel			Stainless Steel		
Tube OD	Wall Thickness	Tube ID	ID Area (sq-in)	CS Burst Pressure	WP - 6:1 (psig)	WP - 4:1 (psig)	SS Burst Pressure	WP - 6:1 (psig)	WP - 4:1 (psig)

## J517 100R-series hose showing maximum working pressure (MWP) with metric and SAE dash size

MPa  
psi

The minimum burst pressure of 100R series hoses is at least four times the maximum working pressure.

The metric basic number is not a dimension; it is a label used to identify the product size.

\*The 100R5 and 100R14 hoses do not fit the same standard as the rest of the 100R Series. The sizes and pressure ratings are shown here.

### Copper Tubing Data

Burst pressures are calculated by Barlow's formula:  $P = (2t \cdot S) / O$  in which P is burst pressure PSI; t is tubing wall thickness; S is ultimate strength of material (32,000 PSI for copper); O is outside diameter of tubing.

# Bend, Flare, and Install a Tube to a Fixture

### Instructions:

Bend, flare, and install a 3/8 in. tube as shown in the illustration.  
Label the tube for later grading. Write the required length answer on the test sheet.

As long as tubing is measured and bent in the same direction, and is measured centerline to centerline, "pickup" will not affect the actual center-to-center measurement.

Nominal Tubing Gain vs. Radius Block Size						
Bend Angle	Tube OD, in					
	1/8	1/4	1/4	5/16	3/8	1/2
	Bend Radius, in					
9/16	9/16	3/4	15/16	15/16	1 1/2	
<b>30°</b>	0	0	0	0	0	1/16
<b>45°</b>	1/16	1/16	1/16	1/16	1/16	1/16
<b>50°</b>	1/16	1/16	1/16	1/16	1/16	1/8
<b>55°</b>	1/16	1/16	1/16	1/8	1/8	1/8
<b>60°</b>	1/16	1/8	1/16	1/8	1/8	3/16
<b>65°</b>	1/8	1/8	1/8	3/16	1/8	1/4
<b>70°</b>	1/8	1/8	1/8	3/16	3/16	5/16
<b>75°</b>	1/8	3/16	3/16	1/4	1/4	3/8
<b>80°</b>	3/16	3/16	3/16	5/16	5/16	7/16
<b>85°</b>	1/4	1/4	1/4	3/8	3/8	9/16
<b>90°</b>	1/4	5/16	5/16	7/16	7/16	11/16

**Note:** Many manufacturers of tube bending equipment publish gain tables. Often, these tables are based on the design and performance characteristics of the tube bender and not the true calculated value required to perform the bend. As a result, values provided in the gain table may not match the mathematically calculated value, but will be accurate when using both a specific manufacturer's tube bender and associated gain table. The table above illustrates a typical manufacturer's gain table.

#### Pre-measuring Bends

A series of bends may be pre-measured. Measure the first bend the correct length. Compensate for each bend after the first by subtracting the amount of gain from the chart for each 90° of bend to allow for stretch. Always custom measure for the last bend to allow for flaring. Making a 3/8 tube assembly with the first bend at 4 inches and the remaining bends at 4 1/4 inches (subtract gain from desired bend length to mark the measurements before bending).

Figure 11

### The Hand Bender: The RADIUS BLOCK OR BENDING BLOCK

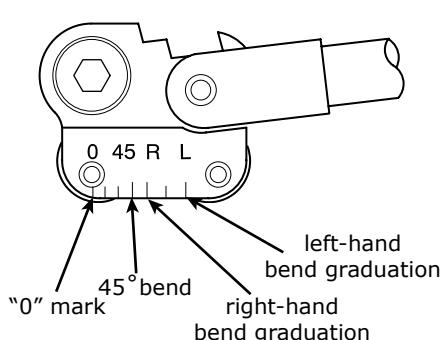

Fig. 1

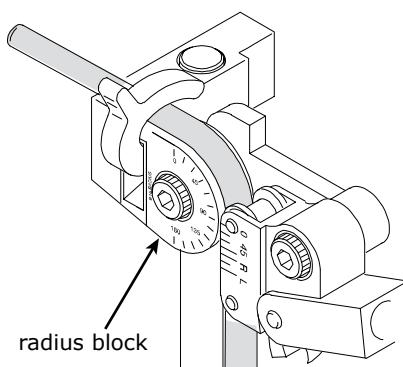

Fig. 2

The radius block (see Fig. 1) is that part of the bender which is a semi-circle block with a round groove on its edge equal to the diameter of the tube to be bent. The radius block also has a flat side which is fastened to the rigid or holding handle. The tube clamp is usually part of the block or attached to the handle at the block. This radius block has the *actual* radius of the block stamped on the side. For a 3/8" diameter tube bender, 15/16"R is the usual block used. The radius block also has numbers and marks stamped at specific points along its edge; these are reference points for various angles. *Note:* Keep bends square or parallel to the flat side of the bending block, not to the handle.

#### Clamp

This is affixed to either the radius block and/or the rigid handle and is used to hold the tube in place while bending. This device may be either part of the handle or attached to the handle.

#### Bending Handle

This handle is attached to the radius block by means of a link. It has a companion groove the same diameter as the tube to be bent. There are marks and numbers stamped on the block end of this handle (see Fig. 2). These are the reference marks used in the bending process.

### Terms used in bending

#### Centerline of the Tubing

The centerline of the tubing is an imaginary line drawn along the radius point of the tube diameter at one end to the radius point of the tube diameter at the other end.

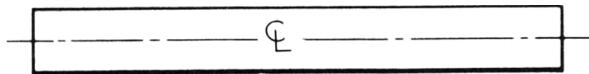

Fig. 3

#### Changes of Plane and/or Direction

Think of the tube as having an imaginary line drawn on the outside from one end to the other. (See Fig. 3) This could be considered as the main plane of the tubing. Changes of plane are accomplished by rotating the tube in the bender.

**Note:** On Fig. 2 the marks "L" and "R" are used depending on whether the mark on the tube is measured from the left "L" or from the right "R". See Fig. 4 and Fig. 5.

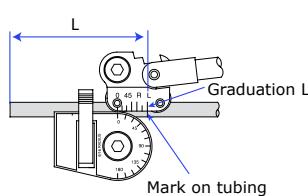

Fig. 4

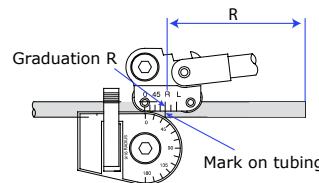

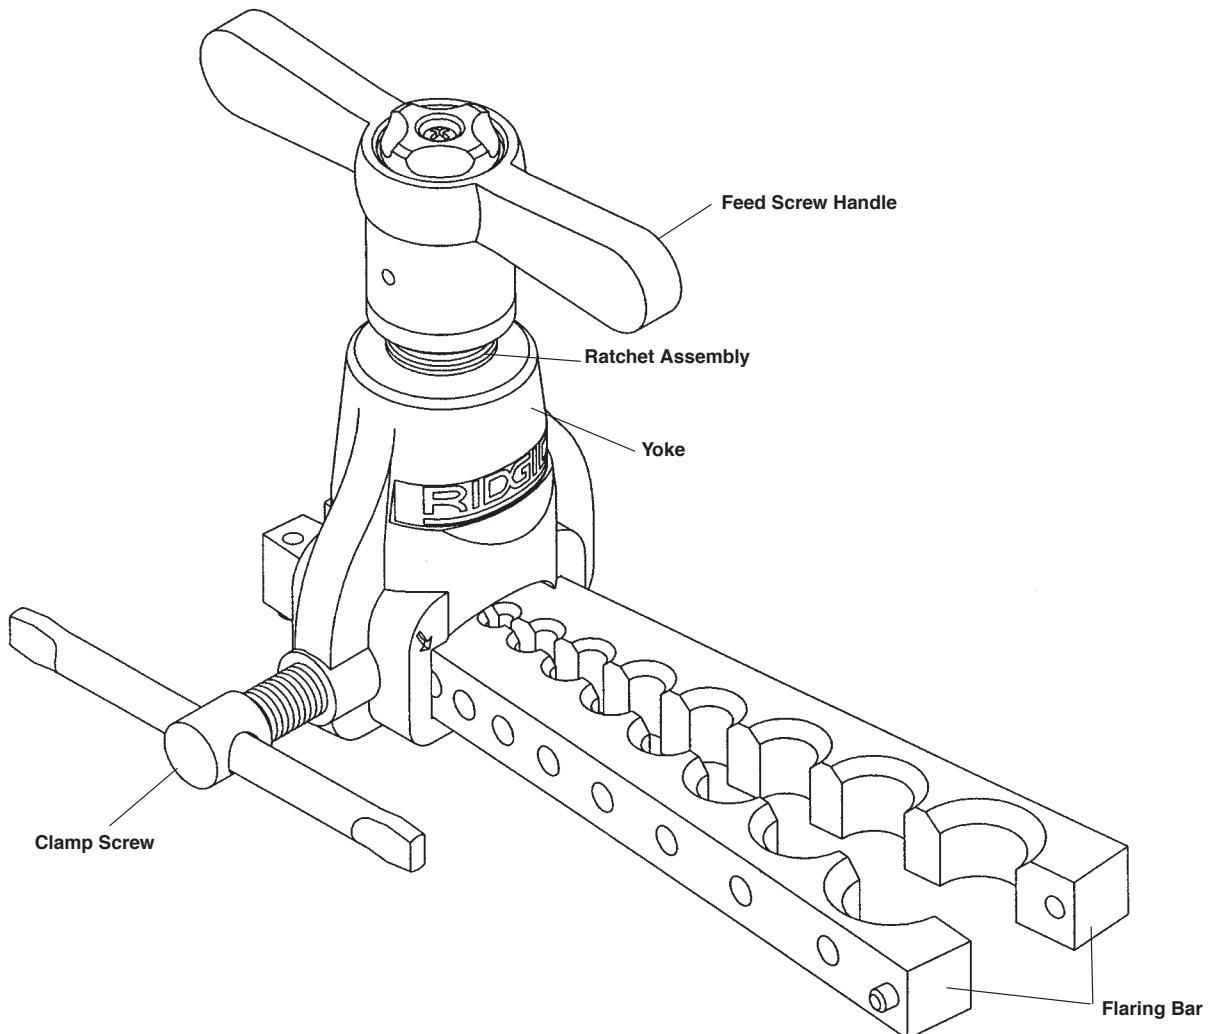

Fig. 5

### Operating Instructions:

1. Cut and ream tubing.
2. Back off feed screw handle and clamp screw to permit flaring bars to slide freely through yoke. Slide yoke to hinged end of flaring bars.
3. Insert tube into proper size opening and close flaring bars. Push tube up from bottom of tool until it is even with top of flaring bars.  
NOTE! OVERRSIZE or UNDERSIZE flares can be made by adjusting tube position slightly above or below the top of flaring bars.
4. Slide yoke forward over tube until arrow on yoke meets line on flaring bars. Tighten clamp screw firmly.
5. Turn the feed screw handle clockwise until pressure kick-out releases. A few additional turns before backing off will burnish flare.
6. Back off feed screw handle as far as it will go. Release clamp screw and slide yoke back. Remove tube. If tube tends to stick, tighten clamp screw against tapered end of bars. This action will force bars open.
